Problem

The company was looking for a shared storage solution to enable scalability.

Solution

With StarWind VSAN, the company created a two-node HA cluster and got the required scalability and fault tolerance at a feasible cost.

Problem

Before StarWind Virtual SAN (VSAN) deployment **Exhibit Options** had an IT infrastructure with Microsoft Hyper-V on top.

The company's point of concern about the IT environment was related to the lack of scalability. Exhibit Options was looking for a VSAN solution to boost its IT infrastructure in terms of high availability (HA), fault tolerance, and scalability.

Solution

Exhibit Options has chosen **StarWind VSAN** because it allowed the company to build a two-node HA cluster, thereby solving the problem of scalability at one go. All that was achieved at an affordable price. Thanks to **StarWind**, the company has the opportunity to add required units to its IT environment and balance unexpected workloads. In the future, Exhibit Options plans to add another two-node cluster to its IT infrastructure powered by StarWind.

StarWind works well and satisfies our requirements.
